

MUSE

Upload your space. Discover what belongs.

Problem Definition

Choosing decorative objects for a space can be overwhelming. People are surrounded by endless product options online, yet they often do not know which object will actually fit their own room.

The difficulty is not only finding a beautiful product, but understanding whether its color, material, scale, form, and mood will belong to the existing space. As a result, users spend time scrolling through countless objects, feeling unsure, indecisive, and disconnected from the room they are trying to style.

Muse responds to this problem by starting with the space instead of the product. By analyzing the user’s uploaded room image, Muse helps people discover decorative objects that are not only visually appealing, but also suitable for their specific environment.

RESEARCH

The research focused on how people choose decorative objects, why they feel uncertain during online shopping, and how visual harmony can be evaluated through spatial qualities. Existing interior platforms, decor marketplaces, AI styling tools, and curated design brands were analyzed to understand their limitations. The main insight was that most platforms prioritize product discovery, while the user’s actual room remains secondary. Muse reverses this logic.

The project explores how color, light, material, surface, form, and scale can become matching criteria between a space and an object. The research also included building a curated object system based on 12 partner brands, where each object can be read through visual metadata such as palette, texture, form, material, and mood.

FUNCTION

Muse functions as an AI-supported decorative styling platform. The user uploads a photo of their room, corner, shelf, or empty surface. The AI Studio analyzes the space by reading its colors, lighting, materials, textures, architectural elements, and overall mood.

Based on this analysis, Muse matches the space with decorative objects from its partner brand inventory. Instead of showing random products, the platform ranks objects according to how well they visually belong to the uploaded environment.

The final experience helps users discover 4-8 curated recommendations, understand why each object fits, and continue to the partner brand’s page if they want to explore or purchase the item.

CONCEPT

The concept of Muse is centered on the relationship between objects and the spaces they belong to. A decorative object is not treated as an isolated product, but as something that gains meaning through the environment it enters.

Muse approaches each room as a visual identity shaped by color, light, texture, material, proportion, and mood. The project suggests that decoration should begin by understanding this existing identity, rather than by browsing through endless options.

Through a calm, warm, and curated digital experience, Muse reframes object selection as a more intentional process. It aims to help users find pieces that feel visually connected to their space, making decoration less random, less overwhelming, and more personal.
